

# BufferZone™

## Security through Virtualization™

Product: *BufferZone Security for Home Users*

Date : 30/11/2005

**BufferZone** v1.6 from TrustWare Ltd. is a revolutionary approach to defense against malicious code that never, ever requires updates. It prevents all viruses, Trojan horses, spyware and unwanted cookies – even those not yet recognized by traditional antivirus software – to be written to disk. **“BufferZone was tested against a handful of randomly selected Win32 malware, including backdoors, worms, Trojans, spyware and Windows viruses. It was able to protect the system against all those selected samples running in the BufferZone,”** says Andreas Clementi of AV Comparatives.

By isolating unauthorized programs and files, **BufferZone** prevents invaders from damaging computers and destroying or transmitting information, while entered programs can be safely run within it. This radical approach lets **BufferZone** provide comprehensive zero-day protection without using attack signatures and updates. It provides complete operating system, application and data protection from all possible threats forever while maintaining compatibility with all known antivirus programs.

Easy to deploy and manage, **BufferZone** v1.6 lets users surf the Internet without a trace of unwanted cookies, history and cyberjunk, and test software installations and updates safely. In fact, other applications can't even see those files, and applications running in BufferZone cannot access designated directories such as “My Secure Documents.” **BufferZone** v1.6 also allows multiple users to use one system without PC change problems and minimizes system downtime.

### Two versions of BufferZone v1.6

A single-application version, available for free download at <http://www.trustware.com/forum>, is aimed especially at the peer-to-peer download market, the largest single group at risk to attacks from viruses, worms, Trojan horses and spyware. It provides protection against hostile code embedded in files downloaded through any one application, including eMule, Limewire, Morpheus, IExplorer, Mozilla FireFox, Skype, and MSNmessenger. A small-office / home version of **BufferZone** protects all applications, including peer-to-peer software, browsers and email clients. It can be downloaded without charge at <http://www.trustware.com/forum>.

### About TrustWare

TrustWare Ltd. develops security software that actively protects against malware (malicious software) and other intrusions to Windows operating systems. TrustWare is an investor-financed, privately-held company based in Tel Aviv, Israel.
