Introduction

This fact sheet¹ is a short overview of the Whole-Product Dynamic Real-World Protection Test results of October 2018. The detailed overall result consumer product reports (covering five months each) are released in July and December. Each of the overall result reports will also contain a false-alarm test and will contain the awards the products reached based on their overall scores during the respective five-month period. **For more information about this Real-World Protection Test, please read the details and previous test reports available on <https://www.av-comparatives.org>**

Tested Cases

Our Real-World Protection Test is currently the most comprehensive and complex test available, using a large number of test cases. Currently, we are running this test under Microsoft Windows 10 Pro RS4 64 Bit with up-to-date third-party software (such as Adobe Flash, Adobe Acrobat Reader, Java, etc.). Due to this, finding in-the-field working exploits and running malware is much more challenging than e.g. under an non-up-to-date system with unpatched/vulnerable third-party applications.

Over the year we evaluate several tens of thousands malicious URLs. Unfortunately, many of these have to be discarded for various reasons. We remove duplicates such as the same malware hosted on different domains or IP addresses, sites already tested, “grey” or non-malicious sites/files, and malware/sites disappearing during the test. Many malicious URLs carrying exploits were not able to compromise the chosen system/applications because of the patch level. This means that the vulnerabilities in the third-party applications on the system were already patched and the exploits could therefore not deliver their malicious payload. Users should be aware that by always keeping their system and third-party applications up-to-date/patched, they can dramatically decrease the risk posed by exploits.

The results are based on the test set of **192** live test cases (malicious URLs found in the field), consisting of working exploits (i.e. drive-by downloads) and URLs pointing directly to malware. Thus exactly the same infection vectors are used as a typical user would experience in everyday life. The test-cases used cover a wide range of current malicious sites and provide insights into the protection given by the various products (using **all** their protection features) while surfing the web.

The following products (latest version available at time of testing) were tested: Avast Free Antivirus 18.7, AVG Free Antivirus 18.7, AVIRA Antivirus Pro 15.0, Bitdefender Internet Security 23.0, BullGuard Internet Security 19.0, Emsisoft Anti-Malware 2018.9, ESET Internet Security 11.2, F-Secure Safe 17.215, K7 Total Security 15.1, Kaspersky Internet Security 19.0, McAfee Internet Security 22.0, Microsoft Windows Defender 4.18, Panda Free Antivirus 18.6, Quick Heal Total Security 17.0, Symantec Norton Security 22.16, Tencent PC Manager 12.3, Trend Micro Internet Security 12.0 and VIPRE Advanced Security 11.0.

¹ The full detailed report will be released in December.

Graph of protection

Every month (from February to June and from July to November) we update the charts on our website showing the protection rates of the various tested products over the various months. The interactive charts can be found on our website². The chart below shows only the protection scores for the month of OCTOBER 2018 (192 test cases). The results of the false-positives test are also shown in the monthly factsheets/graph below.

We would like to point out that while some products may sometimes be able to reach 100% protection rates in a test, it does not mean that these products will always protect against all threats on the web. It just means that they were able to block 100% of the widespread malicious samples used in a test.
